Basic concepts Most people are familiar with some of the basic concepts behind AutoCAD. These concepts include drawing, modeling, text, engineering, and documentation. Creating a new drawing You can create a new drawing in several ways, including using the New Drawing command in the Draw menu, or starting a new drawing at the command line. You can also select Open Drawing from the File menu. All AutoCAD drawings are called drawings or documents. A drawing can be used as a template for other drawings or models. Each drawing can contain one or more layers, where each layer represents a different visual appearance or level of detail. Layers can be positioned on or under other layers, to create effects such as perspective, distance, or depth. The most important part of a drawing is the content. You can add objects such as lines, polylines, points, circles, and text to your drawings. Other features include objects, annotations, titles, and layers. Text and graphics Text is included in AutoCAD for the purpose of creating and maintaining drawings. You can enter text as simple alphanumeric characters, or as complex symbols and diagrams. You can specify text font, font style, color, location, and alignment. Text can be edited directly in your drawing. Graphics can be used to add color and textures to your drawings. They can be used to add objects or other elements in a drawing. You can also use layers, transparency, and perspective to create realistic views of objects. Layers can be used to separate different sections of the drawing. A separate layer can be used for a specific element, such as a structure or a land surface. Editing existing drawings You can edit existing drawings. This process is called editing. You can edit content, such as adding or modifying objects, changing text style and position, and changing the background. You
