Mechanical and chemical stresses of the developing lung induce surfactant synthesis by fetal type II pneumocytes, which arise from lung progenitor cells, alveolar type I pneumocytes, in the embryonic period. A network of stimulatory and inhibitory factors, many of which are likely to act as autocrine or paracrine mediators, plays a role in the regulation of surfactant synthesis in the fetus. Prostaglandins and their precursors, transforming growth factor-beta, fibroblast growth factor, and a variety of other mediators, as well as their specific receptors, regulate surfactant production in the developing lung.
