A stepwise approach to improve the yield of testicular sperm extraction in azoospermia. Testicular sperm extraction is a successful treatment option for men with testicular failure. Although the clinical efficacy of the procedure is very high, the success rate of testicular sperm extraction is still suboptimal. The aim of this study was to develop a stepwise approach to improve the effectiveness of this technique for men with nonobstructive azoospermia. We retrospectively reviewed the medical records of 41 men with obstructive azoospermia who underwent testicular sperm extraction. All patients also had repetitive testicular biopsies, transabdominal ultrasonography, and hysterosalpingography. Five additional patients with azoospermia underwent testicular sperm extraction without previous biopsies or hysterosalpingography. Unilateral testicular sperm extraction was performed in 15 men after biopsy and MRI/ultrasound and biopsy of the contralateral testis. Twelve men also underwent bilateral testicular sperm extraction. Fourteen patients underwent testicular sperm extraction after repeated transabdominal sonography and hysterosalpingography. The mean number of testicular biopsies was 3.07 ± 0.77 . The mean follow-up was 18.5 ± 11.4 months. The overall fertilization rate was 42%. This study showed that the success rate of testicular sperm extraction for men with nonobstructive azoospermia can be improved by making a stepwise approach. The use of the biopsy and transabdominal sonography, followed by the application of intracytoplasmic sperm injection, is efficient in nonobstructive azoospermia patients., 3 , 5 , 8 6 4 1 , 2 / 5 i n d e s c e n d i n g o r d e r . 8 6 4 1 , 5 , 3 , 2 / 5 , 0 S 595f342e71
